## New version of Speereo™ Voice Organizer. Sapie. released.

**Speereo™ Software UK is stepping into a new Smartphone software market. New version supports Windows Mobile 5.0/6.0 no touch screen Smartphones. Now it's easier to control agenda, contacts, tasks and email accounts by voice.**

The program for voice operation was originally created by the company for Pocket PC devices to make important data input easier and faster. Sapie is designed to be operated only by one 'Record' button. Everything else is voice-controlled. It means that you can enter data without stylus or built-in keyboard using just one thumb and 7 basic speech commands.

Cell phones were originally created for voice communication and due to size restrictions they obviously offer limited means of other data input and output: small screens and tiny keyboards. But they do have microphones with good sensitivity and quality speakers. That is where Sapie comes into play. From now on, owners of non-touch-screen devices can become more time-effective with Sapie.

Speereo™ Speech Recognition technology makes your time and data management handy even in noisy environment. You can talk to Sapie as if it is your secretary.

If you say something – it will remember and remind you;

If you ask something - it will answer.

Program Features include:

- Voice Navigation through logically structured interface;
- All data is stored in device's memory, so no need to call out and pay subscription fee;
- Easy one-thumb operation for Record button;
- Speereo™ Speech Recognition technology with 99,9% accuracy;
- 100 % speaker-independency from any user's accent;
- Voice compression algorithm requires 10 times less memory than any of GSM-encoded files;
- Maintain your agenda, contacts, tasks and email accounts;
- Smart voice dialing;
- Unlimited voice comment additions;
- Desktop PC Synchronization.
